# The Budge Go-To-Market strategy

# -

# Resolving the lack of financial literacy

Charles DAUMESNIL, Pavel-Dan DIACONU, Vincent LAMY, Alexandre WAERNIERS

January 22th, 2026

## 1. Executive Summary

**The Problem:**

The "Financial Literacy Paradox"

We are facing an unprecedented societal contradiction. Access to financial information has never been easier, yet true financial understanding has never been more fragile.

- The knowledge gap:
  According to the OECD/INFE 2023 survey, only 52% of adults in the EU achieve a minimum score (50/100) on financial literacy quizzes.
- The misinformation trap:
  A staggering 79% of Gen Z consults social media (TikTok, Instagram, Reddit) for financial advice. They are exposed to high risks of scams, unregulated "Finfluencers," and dangerous speculation.
- A disconnection:
  Existing solutions are siloed. Educational apps (like Zogo) are static and often boring; News apps (like Boursorama) are too complex and expensive.

**The Vision:**

We want to democratize financial literacy. We envision a future where every young adult, regardless of their background, has access to the same quality of financial insight as a high-net-worth individual, thanks to the power of gamification and artificial intelligence.

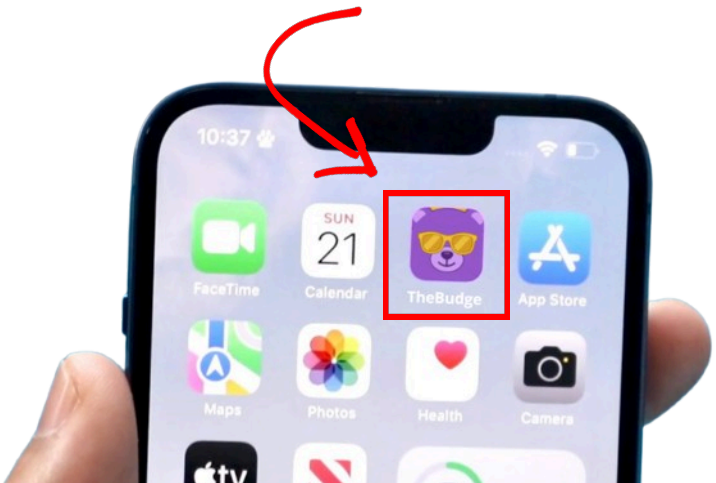
**The Pitch:**

The Budge is the first financial education app specifically designed to bridge the gap between financial literacy (theory) and market reality (news and trends). We act as a "Financial Mentor" for Gen Z and young Millennials (aged 18-39 y.o.), turning anxiety into empowerment.

**Our Solution:**

The Budge is a mobile-native app that solves this by creating a unified ecosystem. We combine gamified learning (Duolingo-style), neuroscience principles like the Ebbinghaus curve (spaced repetition over time) with an AI-powered news aggregator.

Our proprietary AI technology doesn't just display news; it "reads" the market, filters out noise, and explains complex concepts in real-time. We turn the news into a learning moment.



## 2. Market Analysis & User Needs

### A. Macro-economic drivers

- High inflation across Europe and the U.S. has acted as a wake-up call. Young people realize that saving money in a bank account is losing value. They *must* invest, but they don't know how.
- As Gen Z increasingly enters the workforce with growing disposable income, we observe a significant trend of digital-native investors seeking financial growth. While the proliferation of fintech platforms drive high engagement, there is a notable gap in financial literacy. This leads to a rise in speculative investment behaviors, where young investors take on risks without a foundational understanding of market mechanics.

### B. Target audience: deep-dive psychographics

We target the Gen Z and young Millennials (18-39 age bracket), segmented by financial maturity rather than just age.

1. The Anxious Explorer (the beginner)
    - *Profile:* 18-24 years old, students or first job.
    - *Need:* They hear friends talking about Crypto or ETFs and feel "left behind." They want a safe space to learn without judgment.
    - *Role of The Budge:* Their reliable, gamified tutor.
2. The Time-Poor Optimizer (the intermediate)
    - *Profile:* 25-39 years old young professionals.
    - *Need:* They have disposable income but zero time. Their pain point is information overload.
    - *Role of The Budge:* Their automated news analyst.

### C. Competitive mapping

We position The Budge at the intersection of structured education and real-time information.

| Competitor | Category | Weakness | The Budge advantage |
|---|---|---|---|
| **Zogo** | Gamified education | Static content. Users churn once lessons are finished. | High retention: our daily AI news keeps users engaged forever. |
| **Finimize** | Financial news | Too technical. Assumes prior knowledge. | Accessibility: our AI assistant explains jargon instantly and contextually. |
| **TikTok** | Social content | Unverified, dangerous, biased. | Reliability: We aggregate trusted sources (Le Monde, UN, Google News). |

## 3. Value Proposition & UX Design

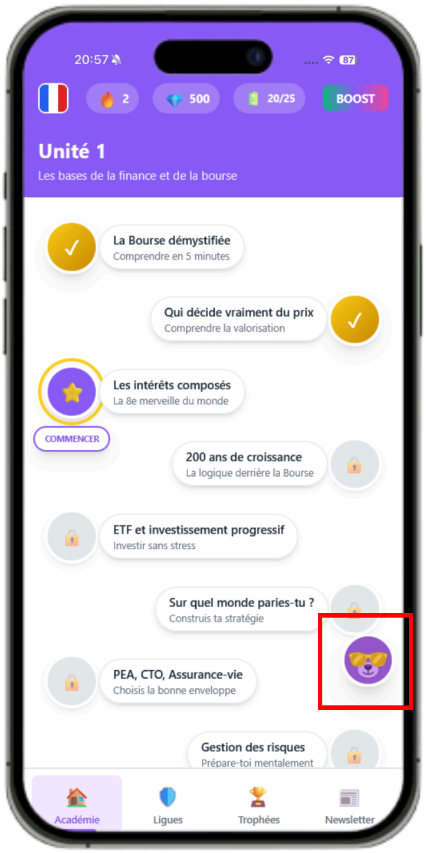
Our competitive edge relies on a serverless, agentic AI architecture. This ensures the project is technically viable, cost-efficient, and scalable.

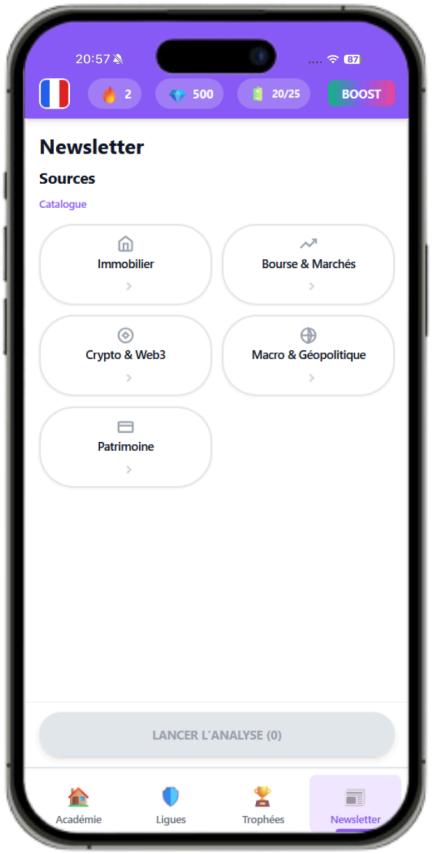
### A. The User Experience: a day in the life

1. 08:00 AM: The user receives a notification: *"The ECB raised rates. Here is what it means for your student loan."* It's hyper-personalized according to user interests.
2. 08:10 AM: The user opens the app. The News Aggregator shows 5 summarized cards related to the chosen topic.
3. 08:13 AM: The user asks vocally "Explain this" in the AI Tutor that floats at the bottom right. The AI writes a small text to explain the concept simply and suggests a 3-minute quiz module to lock in the knowledge. Then the user completes a lesson on the main menu just for fun and receives XP points that rank him in a League!

### B. Core features

The app features two AI assistants working in parallel, on Google Cloud Platform (GCP).





1. **<u>The Pedagogical Tutor</u>** <u>(Gemini + RAG):</u>
   It acts as a context-aware tutor. If a user fails a quiz, it generates a personalized explanation and a new catch-up question.

2. **<u>The Intelligent News Curator</u>** <u>(Agentic Workflow):</u>
   Instead of a blind search, this agent "thinks" first. It scrapes Google News and RSS feeds, filters duplicates, and summarizes the top 5 relevant stories for the user.

**C. Scalability**

Cloud Run (Serverless): We do not manage servers. The infrastructure automatically scales from 10 users to 1 million users. If traffic spikes during a market crash, the app stays online.

## 4. Business Model Strategies: Scenario Planning

To ensure financial sustainability while respecting our ethical mission, we have modeled two strategic revenue hypotheses. This allows us to remain agile depending on user feedback and market conditions.

**Hypothesis 1: The Ecosystem Model (Affiliation + Ads)**

- Concept: The app remains 100% free for the user to maximize growth. Revenue is generated B2B.
- Revenue Streams:
    - In-App advertising: Programmatic ads and rewarded videos (watch an ad to gain a life/heart) for non-intrusive monetization.
    - Strategic affiliation: We partner with curated, ethical financial institutions (e.g., regulated Neo-banks or Savings Apps). When a user completes a course (e.g., "How to open a Savings Plan"), we suggest a partner. We earn a cost per acquisition (CPA) commission for every qualified sign-up. We are currently in discussions with a contact at Trade Republic, who has indicated the possibility of establishing a bespoke referral link, tailored for a platform like ours.
- Strategic Advantage: Removes all friction for user acquisition. High potential for rapid viral growth.

**Hypothesis 2: The Freemium SaaS Model (Subscription + Ads)**

- Concept: A hybrid model relying on monthly recurring revenue (MRR) from power users.
- Revenue Streams:
    - Free Tier: Basic lessons + General News + Ads.
    - Premium Subscription: Removes ads and unlocks the full power of the AI agents (unlimited Q&A with the Tutor, unlimited custom news feeds, deep-dive market analysis) according to different plans:
        - **Booster** for €5.99/month (basic plan),
        - **Family plan** for €9.99/month (up to 3 devices),
        - **Student plan** for €2.99/month (enrollment certificate needed)
- Strategic Advantage: Creates a stable, predictable revenue stream favored by investors. Aligns the company's incentives strictly with the user's education (no conflict of interest).

**Selection Strategy:**

We will launch with a hybrid approach, performing an AB test to see which hypothesis scores better. We will start in the north of France with a low barrier to entry (Free + Ads) to build the community (Hypothesis 1 logic), while offering, in the south of France, the Premium Subscription (Hypothesis 2 logic) to see if they're enough advanced users who want deep-dive AI analysis.

## 5. Go-To-Market Strategy (GTM)

Our strategy focuses on organic growth and community building to keep customer acquisition costs (CAC) low.

**Phase 1: Soft Launch in France**

- Objective: Reach 5,000 monthly active users (MAU) and validate Product-Market Fit.
- Channel 1: "Clean" Influencer Marketing. We will partner with smart content influencers or StudyGram (study influencers) and ethical finance educators on TikTok/LinkedIn. We'll strictly avoid "crypto-bros" to maintain brand safety.
- Channel 2: Campus Ambassador Program. We'll recruit volunteer students in top engineering and business schools to promote the app because trust is highest within peer groups.

Gradual rollout roadmap based on user feedback

**Phase 2: Growth & Scaling**

- Our own referral program: Following the Fintech standard, users will unlock the Booster plan features for 1 month for every friend they refer.
- SEO strategy: We will publish AI-generated news summaries (delayed by 24h) on a blog we'll create. This will make thousands of pages of relevant financial content indexed by Google, driving free organic traffic to the app.

## 6. Responsibility, Ethics & Sustainability

The project is built on a safety-first and sustainable philosophy.

**A. Social Impact (SDG 4: Quality Education)**

- Democratization: We make high-level financial knowledge, usually reserved for educated individuals, accessible to everyone.
- Fighting misinformation: By using an AI workflow that sources only verified media (filtering out fake news), we create a "safe haven" for information.

**B. Data Privacy & Risk Mitigation**

- GDPR compliance:
    - We systematically seek user consent before collecting any data, specifically regarding financial interests and behavioral patterns, and we are strictly committed to never selling this data to third parties.
    - Unlike free AI web apps, our user data is not used to train third party models.
    - We use enterprise-grade APIs (Vertex AI) for secure machine communication.
    - User data is safely stored on Firebase, part of the GCP ecosystem, on data centers located in the EU.
- The "*no advice*" rule: Our system instructions strictly forbid the AI from giving specific investment advice (e.g., "Buy Tesla next month"). It is programmed only to *educate* and *inform*. By focusing on educational content, our model aligns with regulatory frameworks. and allows us to operate without the complex licensing requirements typically mandated by authorities such as the AMF.

## 7. Next Steps & Conclusion

Thus, we showed that we see The Budge as a scalable ecosystem. By leveraging GCP's serverless architecture and Gemini's agentic capabilities, we deliver a hyper-personalized experience that is technically robust and commercially viable. Whether through affiliation or subscription, the business model is designed to support long-term growth, at first in the European market, then scaling in North America.

Now we have to :

- Technically:
    - Finish the backend integration of the lesson progression on Firebase
    - Link progression with streak, rewards (gems, XP, trophies) and energy
    - Fine tune the article fetching service (both system instructions and clean sources)
    - Create many many many more lessons
- Commercially:
    - Conduct a beta testing among friends as soon as possible to get IRL feedback
    - Obtain actionable tasks from our contact at Trade Republic for the referral link
    - Recruit volunteer students in other business schools and universities to promote the app, so that we earn awareness and even more user feedback
    - For the SEO strategy, create the blog and start to upload relevant AI-generated summaries of articles

...all that before February 27th.

Let's go!
